## The Competition

Uses Slippery Round-Tip/Bullet Nose Set Screws

\*150 in./lbs. Pictured Above

SnoBar patented the first bar-style snow retention system in 1992 using non-penetrating clamps. This innovation was the world's first snow retention system featuring posi-lock, cupped-tip set screws. This technology permanently locks the clamp to the seam as opposed to "round tip/Bullet Nose" set screws that rely on friction and high-torque compression. Our exclusive posi-lock cupped-tip set screws contact a wider area of the seam and permanently locks in place for a lifetime attachment without penetrations.

We guarantee the performance, parts, and finish of our products, **for free**, for the life of the roof. Be sure to read the competition's fine print, some charge up to \$1,500 for **each** site inspection plus 8% of the invoice. SnoBar does not believe in charging hidden fees to stand behind what we sell. If we design it, it's guaranteed to work for the life of the roof, period.
